

Report X: Homework Report Template

Your name

September 29, 2025

1 Introduction

Summary of the work you've done, what are the topics we cover in this seminar, etc. Remember that you should deliver this report at the start of the seminar.

What is the main topic related to distributed systems covered in this seminar? Why is it important?

2 Main problems and solutions

!!! The problem: When a slave ignores a message, it still increments its sequence number $N+1$, but it never sends the acknowledgment. This means:

!!! we don't need to handle crashing for the bonus point right?

Summarize your problems, proposed solutions, etc. You do not need to copy&paste your code. Only if needed, you may write down small code snippets to show how you have solved a specific problem/question.

Did you find any specific problem with the development of your solution? How did you solve it?

If you want to give a code example you can do it using the verbatim environment.

```
this(X) ->  
  Y = is(X),  
  a(test(Y)).
```

3 Evaluation

If needed, you may provide figures or tables with main results evaluating your proposals. For each seminar, we will provide you with some guidance on which kind of evaluation you should do.

And Figures 1 and ?? shows how to add a figure with some results. These figures have been created with gnuplot. There are tons of different kinds of plots that can be generated with gnuplot. Make sure to check out

Figure 1: Some random results 1

<http://gnuplot.info/demo/> and look at them so you can see what can you do with this program.

To obtain these figures you have to:

1. Create the data file from the experiments (look at file `experiment.dat`)
2. Create a gnuplot file to create a figure in eps format (look at files `results1.plot` and `results2.plot`). These files may be very complex. But for the results we want to show, these examples are enough. To create the eps figures, execute in terminal:

```
$> gnuplot results1.plot
```

3. As `pdflatex` does not recognize eps files, you must convert them to pdf files. This is done by (it will generate a file `results1.pdf`):

```
$> epstopdf results1.eps
```

4. That's it! Just include the figure as shown in this template and compile the latex as explained in the document "Introduction to \LaTeX 2 ϵ ".

If you want, you can also create a table of results as Table 1. If you look at the template code, you will see how to do a table in \LaTeX .

Figure 2: Some random results 2

First column	Second column	Third column
Case 1	1.1	1.2
Case 2	2.1	2.2
Case 3	3.1	3.2

Table 1: Some random results in a table

4 Conclusions

Change the layout of this template as you want. It's only for your guidance but if you feel that you need a different structure, feel free to change it. The report should not be too long (\approx 2-3 pages).

What have you learnt from the problem presented? Was it useful?
